

Was ist Intelligenz? Und wie mache ich sie künstlich? Grundlagen von KI

DER WISSENSCHAFTLER **Prof. Dr. Danko Nicolić** Senior Data Scientist

What is intelligence and how do I make it artificial?

1. What is intelligence?

2. Stages in the development of AI

3. Future

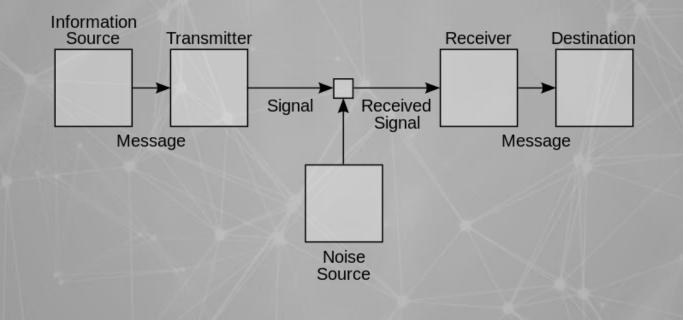

There is no such thing as

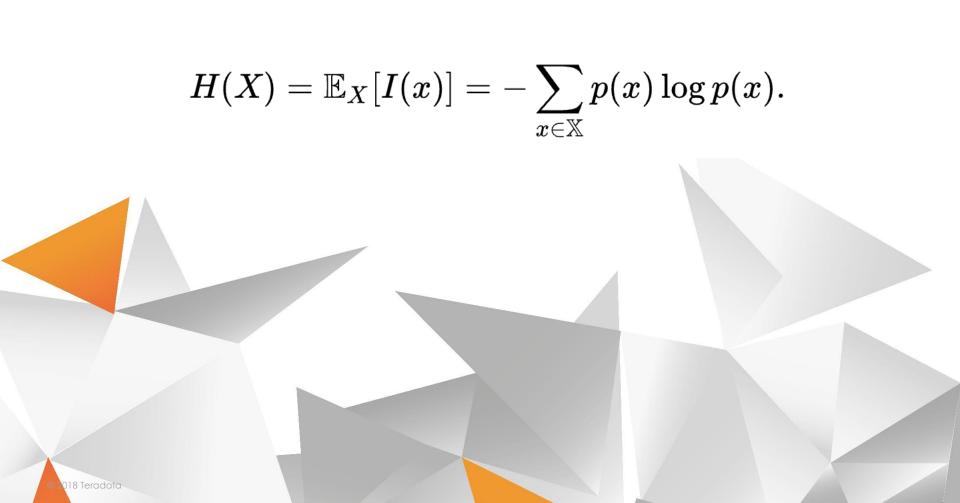

mathematical theory of intelligence

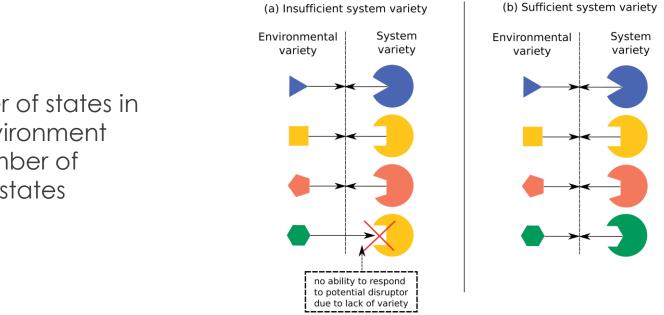

Theory of communication/information

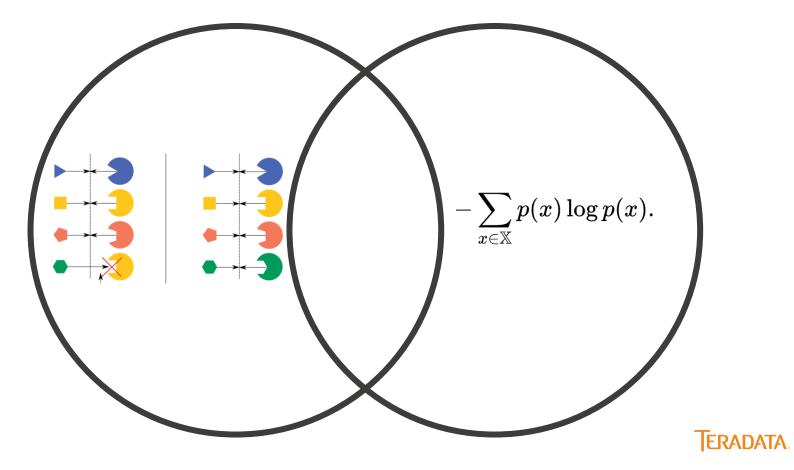

Requisite variety theorem

Number of states in the environment vs. number of system states

Two stages in the history of AI

Direct programming

Intelligent behaviour explicitly specified by human programmers and experts (if-then rules).

Machine learns on its own

Only a few general rules are directly specified. The machine learns the rest on its own.

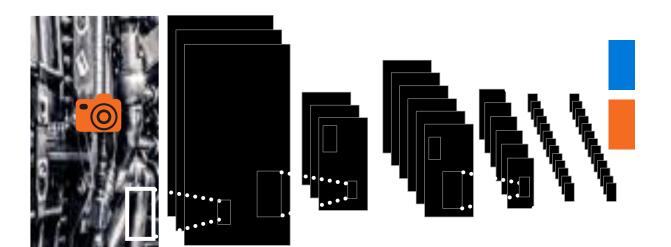

Good old-fashioned Al

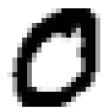

DEEP LEARNING

1. Training

2. Production

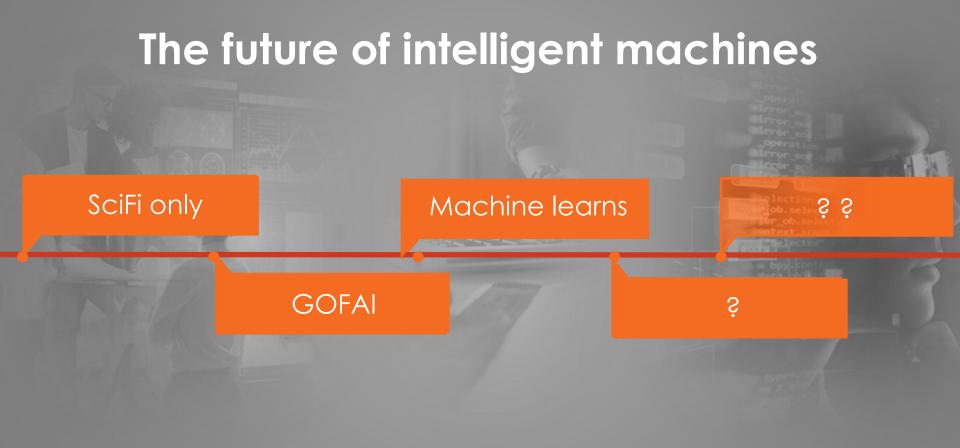

HIDDEN FACT OF TODAY

It is always:

machine learning + GOFAI

We need "small data" AI

Small data, big applicability

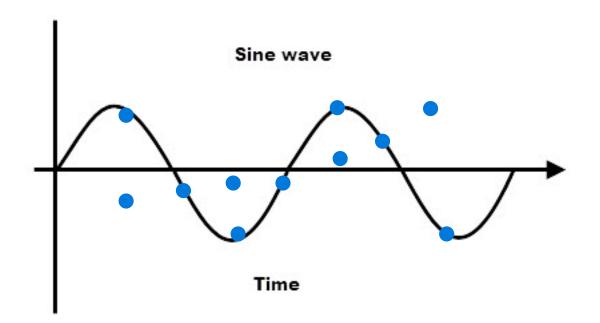

The universe of all possible applications of machine learning that can be trained using small amounts of data.

Big data, small applicability

All possible applications of machine learning tool that require big data for training

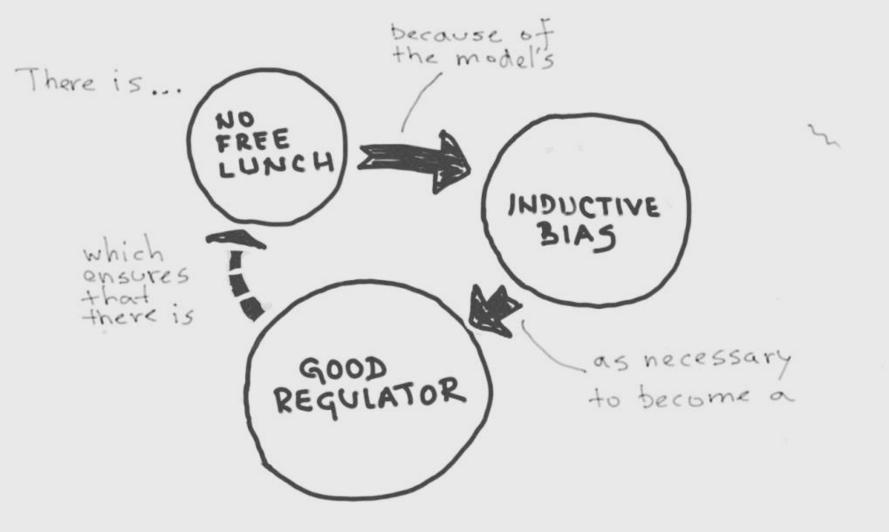

Inductive bias

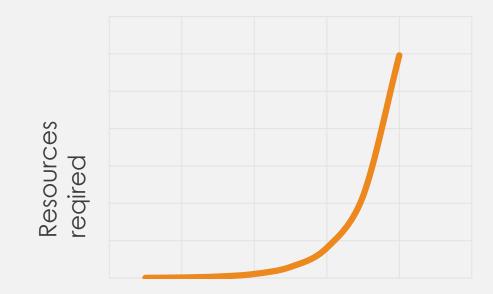

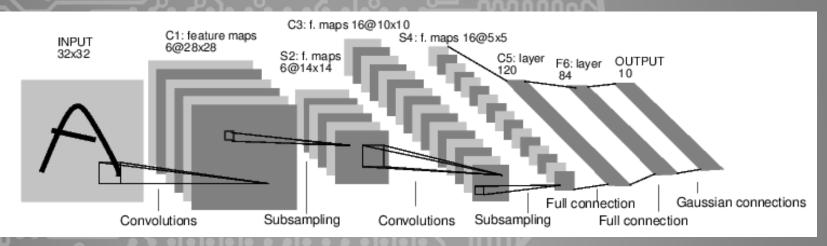

Intelligence of deep learning does not scale well

Number of categories to distinguish

Learn smarter

E	

Summary

1. No math theory of intelligence yet?

2. Two main stages in the history of AI

3. Future looks bright
